

Computer simulations

Simulation: imitation of any real thing, state or process.

Creating a virtual model on computer through software, which is a image of reality. / e.g. machine part under load /

REALITY

COMPUTER VIRTUAL MODEL

FEM, Finite Element Method

Mathematical method: converting a problem to a system of linear equations.

Discretion: substitution a continuous environment with a set of points.

Origin since approx 1950. Full use by computers.

continuous image substituted with pixels

inaccuracy
non continuous

continuous volume substituted with a set of points.

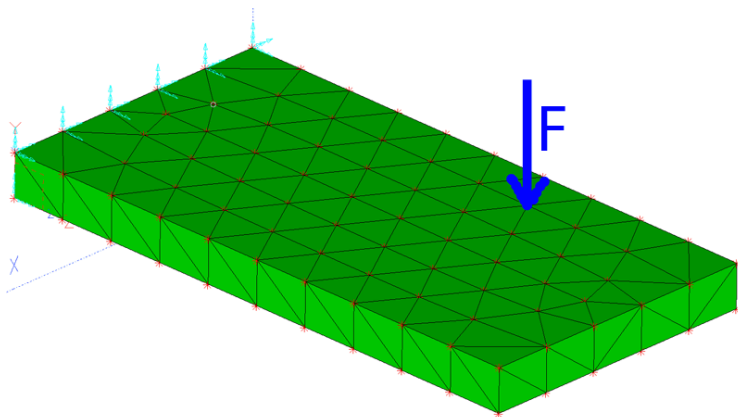

Mesh of elements. definition of geometry.

Computer simulation FEM, basic process

Preprocessor >>>>

creation of a computational model

Processor

Calculate of job
(system of linear
equations)

>>>> **Postprocessor**

Displaying and evaluating results

Cost optimization: minimizing licenses for solvers

Computational model

MESH

Body definition.

Definition of the geometry:

- **Elements** (e.g. tetrahedrons, 3D geometry parts for 3D task)
- **Nodes** (points, vertices of elements)

Material: relevant characteristics for kind of simulation

BOUNDARY CONDITIONS

Conditions of the state or process. External action or constraint on the body.

- Constraints
- Loads (force, torque)

Computational model

Calculation of the computational model

Solving of system of linear equations - matrix. Requires CPU performance.

Solver

- Usually external performance servers
- Solver licenses separately from viewers or model preparation

Optimization: write a matrix to a computer, calculation time, applied Math

Designer in industry: work with the simulation program

Results of computer simulation

Display & Evaluation

Display

- Trough software

Evaluation

- Relevance of the results
- Divergence of the results from the exact values /rate of difference, FEM method/
- Possibility of use the results, exact or approximate indicative
